

granite (sequential, A_4=0.35) exceeds falcon15 (parallel, 0.21): acceptance tracks functional attention-dependence, not the parallel/sequential label; the red dotted line marks granite's level for cross-panel comparison. The pure-Transformer control (qwen2.5-0.5b) is drawn in BOTH panels as a shared reference baseline. k=8 for the original models is reported in the tables; curves are capped at k∈{2,4} for uniform coverage across all models.
